Configuring a project for Che

This will prepare any project workspace to be brought into Che running in Docker.

Copy the files from one of our projects.

- See: https://github.com/DevEnvy-HackWithFriends/web-java-spring
- Copy the following files into the root folder of your project:
    - cheFile
    - cheUp.sh
    - cheStatus.sh
    - cheDown.sh

Update the cheFile

The cheFile defines the workspace. Read the following documentation to configure and update the cheFile. https://eclipse.org/che/docs/chedir/chefiles/index.html
